

1.0 Phase 1: Business process for bank customer churn

1.1 Business Description

I assume the role of manager at A-Z Bank PLC. This bank is a multinational bank with customers from many countries. The bank provides financial services to all of its clients through a variety of products. Several customer lifecycle management topics that were emphasized in the work of Buttle and Maklan (2009) and CAS (2024) were considered. Among these topics, the bank actively employs the customer focus, customer acquisition, and customer retention. This is displayed in figure 1.

1.2 The core business process analysis

This employs both physical and virtual interaction means with the customers, then introduces the predefined means of managing the customers' intent. Below are the brief details of these means.

1. Customer focus: It is a means of prioritizing the needs of the customer (CAS, 2024). The A-Z Bank addresses the customer's needs through various products such as checking and saving accounts, credit cards, loans, and investments. However, the turnaround to get any of these services is not less than 24 hours. This led to the intuitiveness of asking, **How can the product process be improved within less time?**
2. Customer acquisition: More customers are acquired through promotional offers and internet-based advertisements that pop up to all internet users, etc. Since the customers are from different countries, the income or socio-economic differences of these countries is enough to induce customer churning if not considered on the operational charges (cost). Thus, **which equity void of bias to be employed?** Is thought to be deduced from the data mining.
3. Customer retention: As customers are acquired, strategies are employed to retain them. These are done through a loyalty scheme and customer clubs based on the customer's years of activeness and customer care services to address each customer's delight and complaint. Despite this, some customers are still not satisfied; to solve this issue, the question is: **what plans are appropriate to prevent defection of non-satisfied customers?**

1.3 Optimization potential

1. Performance (Shorten the turnaround time)
2. Equity strategy (normalize the economic differences of the customer countries)
3. Follow-up plans on non-satisfied customers

1.4 Possible questions

1. How can the product process be improved within less time?
2. Which equity void of bias should be employed?
3. What plans are appropriate to prevent defection of non-satisfied customers?
